Welcome to

LL Metal Materials Technology Inc.

(LL Technologie des Matériaux Métalliques Inc., name in french)

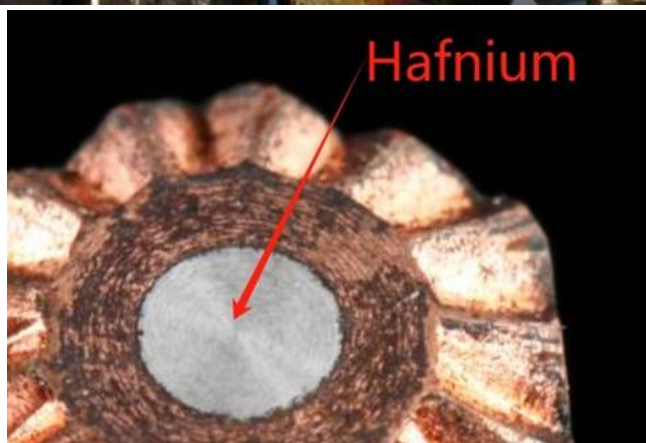

A Niche Market Player

LL Metal – Specialized Supplier for Hafnium, especially used in Plasma Cutting

LL Metal, with head office in Quebec, Canada, is a very specialized supplier with focus on hafnium used in electrode for air/oxygen plasma cutting.

In plasma cutting, the electrode is the most important consumable as it could lead to torch damage faster than any other consumables.

The part of the electrode that makes the arc is called Hafnium; it is in the center of the electrode and will get about 4000 degrees when cutting. As it wears little pieces fall out and a divot/hole will appear in the end of the electrode. The Hafnium is only about 1/8" deep so the users have to keep this in mind before making long cuts or cutting out something.

The time to change the electrode is when the divot/pit/hole in the end of the electrode gets to be 1/16" deep or so. Of course, there are some other reasons to change the electrode also, even if it does not look bad.

The hafnium emitter is bonded to the copper electrode body in different ways. Better quality electrodes made by some manufacturers might have a proprietary manufacturing technique and use specialized copper alloy and hafnium diameter as well as a proprietary swaging technique to allow the best heat transfer from the hafnium and the copper, providing much longer life than other commercial brands.
